## **Practical 1**

**Aim:** Write a Python3 program to perform randomized selection of an array.

**Code:**

```
from random import randrange

def partition(x, pivot_index = 0):
    i = 0
    if pivot_index != 0: x[0],x[pivot_index] = x[pivot_index],x[0]
    for j in range(len(x)-1):
        if x[j+1] < x[0]:
            x[j+1],x[i+1] = x[i+1],x[j+1]
            i += 1
    x[0],x[i] = x[i],x[0]
    return x,i

def RSelect(x,k):
    if len(x) == 1:
        return x[0]
    else:
        xpart = partition(x,randrange(len(x)))
        x = xpart[0] # partitioned array
        j = xpart[1] # pivot index
        if j == k:
            return x[j]
        elif j > k:
            return RSelect(x[:j],k)
        else:
```

```
k = k - j - 1
```

```
return RSelect(x[(j+1):], k)
```

```
x = [3,1,8,4,7,9]
```

```
for i in range(len(x)):
```

```
    print (RSelect(x,i))
```

**Output:**

1

3

4

7

8

9

## **Practical 2**

**Aim:** Write a Python3 program to perform heap sort on an array.

### **Code:**

```
# To heapify subtree rooted at index i.
# n is size of heap
def heapify(arr, n, i):
    largest = i # Initialize largest as root
    l = 2 * i + 1    # left = 2*i + 1
    r = 2 * i + 2    # right = 2*i + 2

    # See if left child of root exists and is
    # greater than root
    if l < n and arr[i] < arr[l]:
        largest = l

    # See if right child of root exists and is
    # greater than root
    if r < n and arr[largest] < arr[r]:
        largest = r

    # Change root, if needed
    if largest != i:
        arr[i],arr[largest] = arr[largest],arr[i] # swap

    # Heapify the root.
    heapify(arr, n, largest)
```

# The main function to sort an array of given size

```
def heapSort(arr):
```

```
    n = len(arr)
```

```
    # Build a maxheap.
```

```
    for i in range(n, -1, -1):
```

```
        heapify(arr, n, i)
```

```
    # One by one extract elements
```

```
    for i in range(n-1, 0, -1):
```

```
        arr[i], arr[0] = arr[0], arr[i] # swap
```

```
        heapify(arr, i, 0)
```

```
# Driver code to test above
```

```
arr = [ 12, 11, 13, 5, 6, 7]
```

```
heapSort(arr)
```

```
n = len(arr)
```

```
print ("Sorted array is")
```

```
for i in range(n):
```

```
    print ("%d" %arr[i]),
```

### **Output:**

Sorted array is

5

6

7

11

12

13

## **Practical 3**

**Aim:** Write a Python3 program to perform radix sort on an array.

**Code:**

```
# Python program for implementation of Radix Sort
# A function to do counting sort of arr[] according to
# the digit represented by exp.

def countingSort(arr, exp1):
    n = len(arr)
    # The output array elements that will have sorted arr
    output = [0] * (n)
    # initialize count array as 0
    count = [0] * (10)
    # Store count of occurrences in count[]
    for i in range(0, n):
        index = (arr[i]/exp1)
        count[int((index)%10)] += 1

    # Change count[i] so that count[i] now contains actual
    # position of this digit in output array
    for i in range(1,10):
        count[i] += count[i-1]

    # Build the output array
    i = n-1
    while i>=0:
        index = (arr[i]/exp1)
```

```

        output[ count[ int((index)%10) ] - 1] = arr[i]
        count[int((index)%10)] -= 1
        i -= 1

# Copying the output array to arr[],
# so that arr now contains sorted numbers
i = 0
for i in range(0,len(arr)):
    arr[i] = output[i]

# Method to do Radix Sort
def radixSort(arr):

    # Find the maximum number to know number of digits
    max1 = max(arr)

    # Do counting sort for every digit. Note that instead
    # of passing digit number, exp is passed. exp is 10^i
    # where i is current digit number
    exp = 1
    while max1/exp > 0:
        countingSort(arr,exp)
        exp *= 10

# Driver code to test above
arr = [ 170, 45, 75, 90, 802, 24, 2, 66]
radixSort(arr)
for i in range(len(arr)):
    print(arr[i]),

```

**Output:**

2

24

45

66

75

90

170

802

## **Practical 4**

**Aim:** Write a Python3 program to perform bucket sort on an array.

**Code:**

```
# Python3 program to sort an array
# using bucket sort
def insertionSort(b):
    for i in range(1, len(b)):
        up = b[i]
        j = i - 1
        while j >= 0 and b[j] > up:
            b[j + 1] = b[j]
            j -= 1
        b[j + 1] = up
    return b

def bucketSort(x):
    arr = []
    slot_num = 10 # 10 means 10 slots, each
                   # slot's size is 0.1
    for i in range(slot_num):
        arr.append([])

    # Put array elements in different buckets
    for j in x:
        index_b = int(slot_num * j)
        arr[index_b].append(j)
```

```

# Sort individual buckets
for i in range(slot_num):
    arr[i] = insertionSort(arr[i])

# concatenate the result
k = 0
for i in range(slot_num):
    for j in range(len(arr[i])):
        x[k] = arr[i][j]
        k += 1
return x

# Driver Code
x = [0.897, 0.565, 0.656,
     0.1234, 0.665, 0.3434]
print("Sorted Array is")
print(bucketSort(x))

```

### **Output:**

Sorted Array is  
[0.1234, 0.3434, 0.565, 0.656, 0.665, 0.897]

## **Practical 5**

**Aim:** Write a Python3 program to perform Floyd-Warshalls algorithm on a weighted graph.

**Code:**

```
# Python Program for Floyd Warshall Algorithm
```

```
# Number of vertices in the graph
```

```
V = 4
```

```
# Define infinity as the large
```

```
# enough value. This value will be
```

```
# used for vertices not connected to each other
```

```
INF = 99999
```

```
# Solves all pair shortest path
```

```
# via Floyd Warshall Algorithm
```

```
def floydWarshall(graph):
```

```
    """ dist[][] will be the output
```

```
    matrix that will finally
```

```
        have the shortest distances
```

```
        between every pair of vertices """
```

```
    """ initializing the solution matrix
```

```
    same as input graph matrix
```

```
    OR we can say that the initial
```

```
    values of shortest distances
```

```
    are based on shortest paths considering no
```

intermediate vertices """

```
dist = list(map(lambda i: list(map(lambda j: j, i)), graph))
```

""" Add all vertices one by one  
to the set of intermediate  
vertices.

---> Before start of an iteration,  
we have shortest distances  
between all pairs of vertices  
such that the shortest  
distances consider only the  
vertices in the set  
 $\{0, 1, 2, \dots, k-1\}$  as intermediate vertices.

----> After the end of a  
iteration, vertex no. k is  
added to the set of intermediate  
vertices and the  
set becomes  $\{0, 1, 2, \dots, k\}$

"""

```
for k in range(V):
```

```
    # pick all vertices as source one by one  
    for i in range(V):
```

```
        # Pick all vertices as destination for the  
        # above picked source
```

```
for j in range(V):
```

```
    # If vertex k is on the shortest path from
```

```
    # i to j, then update the value of dist[i][j]
```

```
    dist[i][j] = min(dist[i][j],
```

```
                    dist[i][k] + dist[k][j]
```

```
    )
```

```
printSolution(dist)
```

```
# A utility function to print the solution
```

```
def printSolution(dist):
```

```
    print ("Following matrix shows the shortest distances\between every pair of vertices")
```

```
    for i in range(V):
```

```
        for j in range(V):
```

```
            if(dist[i][j] == INF):
```

```
                print ("%7s" % ("INF")),
```

```
            else:
```

```
                print ("%7d\t" % (dist[i][j])),
```

```
            if j == V-1:
```

```
                print ("")
```

```
# Driver program to test the above program
```

```
# Let us create the following weighted graph
```

```
"""
```

```
graph = [[0, 5, INF, 10],
         [INF, 0, 3, INF],
         [INF, INF, 0, 1],
         [INF, INF, INF, 0]
        ]
```

# Print the solution

```
floydWarshall(graph)
```

### **Output:**

Following matrix shows the shortest distances between every pair of vertices

```
0
5
8

## **Practical 6**

**Aim:** Write a Python3 program to perform counting sort on an array

**Code:**

```
# The main function that sort the given string arr[] in
# alphabetical order
def countSort(arr):

    # The output character array that will have sorted arr
    output = [0 for i in range(256)]

    # Create a count array to store count of individual
    # characters and initialize count array as 0
    count = [0 for i in range(256)]

    # For storing the resulting answer since the
    # string is immutable
    ans = ["" for _ in arr]

    # Store count of each character
    for i in arr:
        count[ord(i)] += 1

    # Change count[i] so that count[i] now contains actual
    # position of this character in output array
    for i in range(256):
        count[i] += count[i-1]
```

```

# Build the output character array
for i in range(len(arr)):
    output[count[ord(arr[i])]-1] = arr[i]
    count[ord(arr[i])] -= 1

# Copy the output array to arr, so that arr now
# contains sorted characters
for i in range(len(arr)):
    ans[i] = output[i]
return ans

# Driver program to test above function
arr = "geeksforgeeks"
ans = countSort(arr)
print ("Sorted character array is %s" %"".join(ans))

```

### **Output:**

Sorted character array is eeefggkkorss

## **Practical 7**

**Aim:** Write a Python3 program to perform set covering problem.

**Code:**

```
def set_cover(universe, subsets):  
    """Find a family of subsets that covers the universal set"""  
    elements = set(e for s in subsets for e in s)  
    # Check the subsets cover the universe  
    if elements != universe:  
        return None  
    covered = set()  
    cover = []  
    # Greedily add the subsets with the most uncovered points  
    while covered != elements:  
        subset = max(subsets, key=lambda s: len(s - covered))  
        cover.append(subset)  
        covered |= subset  
  
    return cover  
  
def main():  
    universe = set(range(1, 11))  
    subsets = [set([1, 2, 3, 8, 9, 10]),  
               set([1, 2, 3, 4, 5]),  
               set([4, 5, 7]),  
               set([5, 6, 7]),  
               set([6, 7, 8, 9, 10])]  
    cover = set_cover(universe, subsets)
```

```
print(cover)
```

```
if __name__ == '__main__':  
    main()
```

**Output:**

```
[[{1, 2, 3, 8, 9, 10}, {4, 5, 7}, {5, 6, 7}]]
```

## **Practical 8**

**Aim:** Write a Python3 program to perform subset sum problem.

**Code:**

```
# A recursive solution for subset sum
# problem

# Returns true if there is a subset
# of set[] with sum equal to given sum
def isSubsetSum(set, n, sum) :

    # Base Cases
    if (sum == 0) :
        return True
    if (n == 0 and sum != 0) :
        return False

    # If last element is greater than
    # sum, then ignore it
    if (set[n - 1] > sum) :
        return isSubsetSum(set, n - 1, sum);

    # else, check if sum can be obtained
    # by any of the following
    # (a) including the last element
    # (b) excluding the last element
    return isSubsetSum(set, n-1, sum) or isSubsetSum(set, n-1, sum-set[n-1])
```

```
# Driver program to test above function
set = [3, 34, 4, 12, 5, 2]
sum = 9
n = len(set)
if (isSubsetSum(set, n, sum) == True) :
    print("Found a subset with given sum")
else :
    print("No subset with given sum")
```

**Output:**

Found a subset with given sum
